# Soil Classification in Myanmar

- ❖ Agricultural Planning Commission made a classification mainly based on data of aerial photo interpretations in 1955-1957.
- ❖ Land Use Bureau made a general scientific classification with the help of Soviet Soil Expert in 1957 based on the Russian system.
- ❖ As it needs to revise, redefine for adoption, a new classification system was imperatively needed.
- ❖ The old classification system was modified in 1970 by Land Use Division of Myanmar Agriculture Service to correlate it with the FAO/UNESCO Classification.
- ❖ Currently, Land Use Division, DOA is doing soil survey and soil mapping for district and township level of Myanmar.

# Soil Classification in Myanmar

- ❖ Agricultural Planning Commission made a classification mainly based on data of aerial photo interpretations in 1955-1957.
- ❖ Land Use Bureau made a general scientific classification with the help of Soviet Soil Expert in 1957 based on the Russian system.
- ❖ As it needs to revise, redefine for adoption, a new classification system was imperatively needed.
- ❖ The old classification system was modified in 1970 by Land Use Division of Myanmar Agriculture Service to correlate it with the FAO/UNESCO Classification.
- ❖ Currently, Land Use Division, DOA is doing soil survey and soil mapping for district and township level of Myanmar.
- ❖ In 2016, Land Use Division, DOA is collaborating with LDD, Thailand under the ACMECS project, WRB Soil Classification System is introduced in Sin Thay Sub-watershed area, Tatkone Township, Myanmar.

## Objective

### Strategy 1 Database for soil resource and land use planning

- 1. Soil survey: soil resources database/soil mapping/soil interpretation/soil analysis/soil monolith
- 2. Land area potential assessment: present land use mapping/socio-economic survey/land use planning/land evaluation

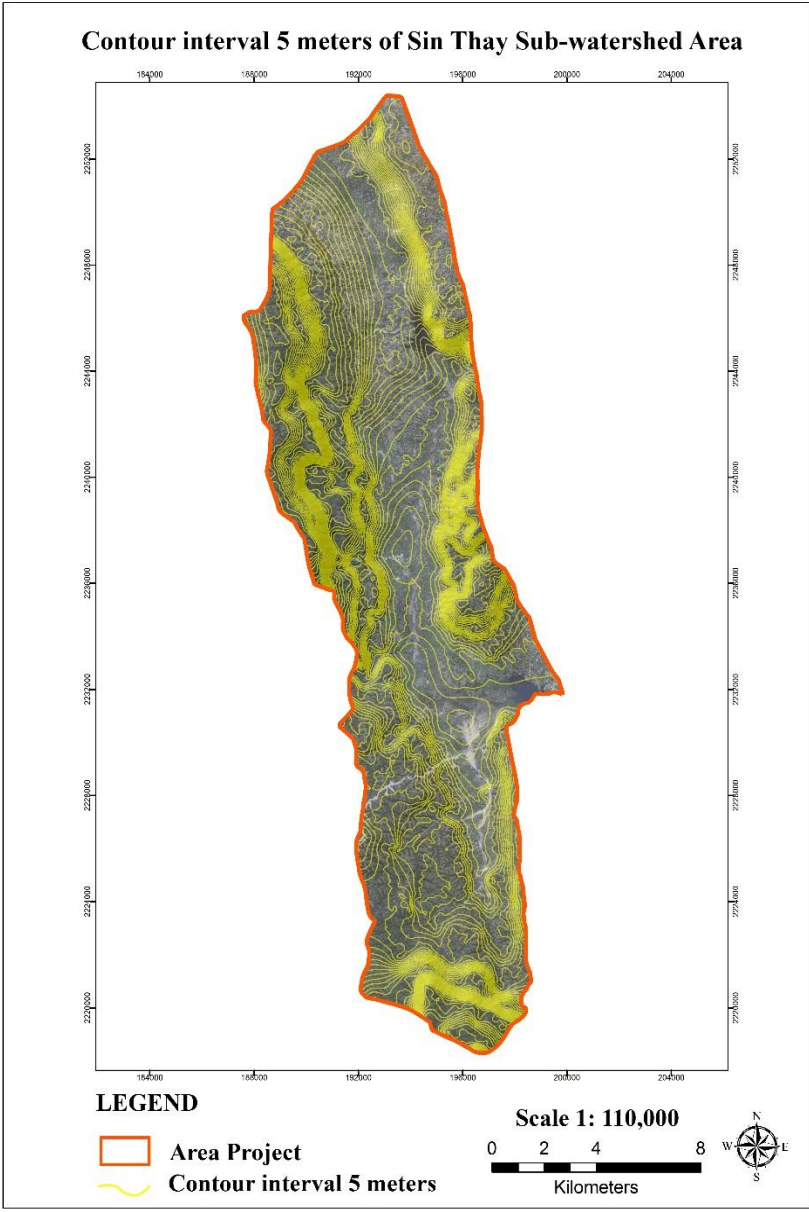

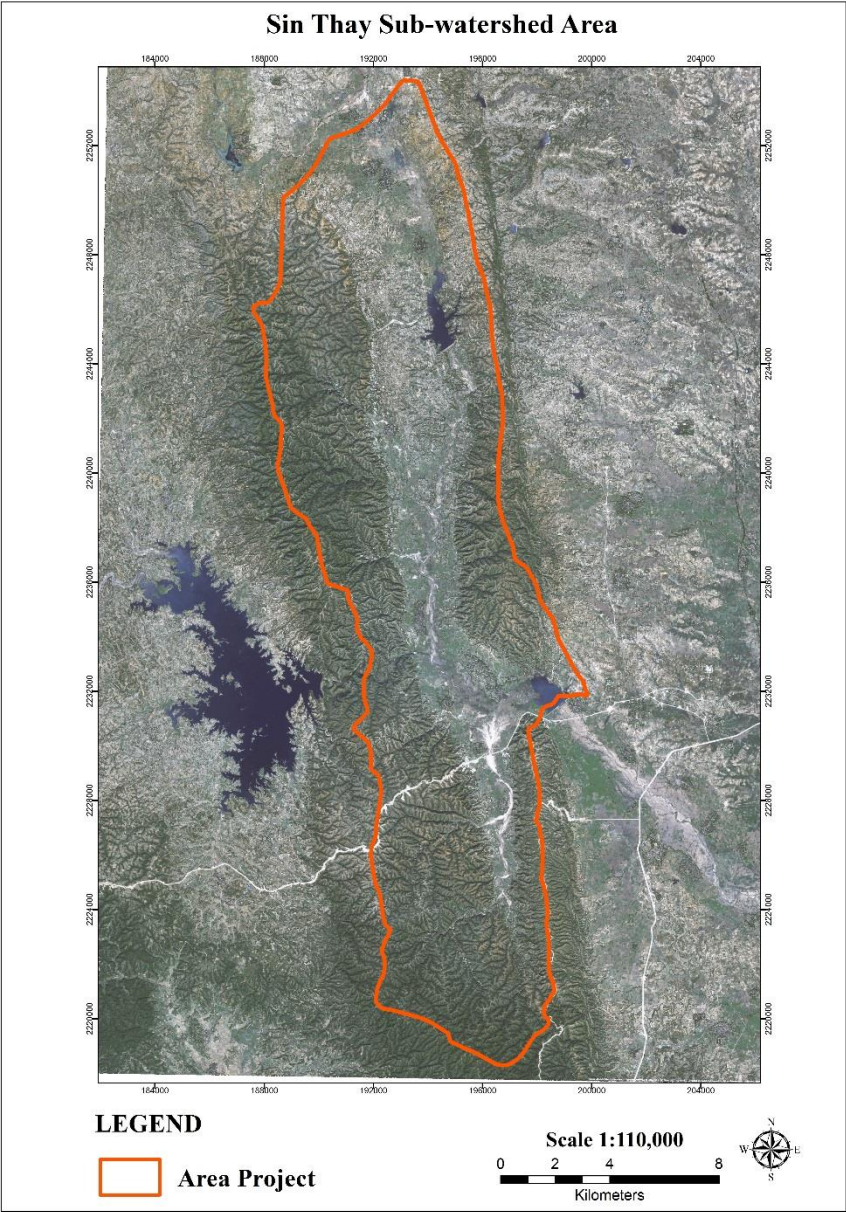

**Training Course on  
“Introduction to Soil Survey and Land-Use Planning”  
for Officials of Cambodia, Lao PDR and Myanmar  
Under the collaboration project of ACMECS**

**14-24 March 2016**

**At Land Development Department, Bangkok**

# Sin Thay Subwatershed

## Location

Sin Thay subwatershed is located in Tatkon township of Nagaland Union Territory, Myanmar, with a total area of approximately 23,000 ha.

## Topography and Elevation

## Relief and Slope

## Soil resources

**Upland** mostly occur on river terrace, the soils are stratified throughout the soil profile which have coarse-textured and appreciable amounts of carbonate. These soils are very important for upland crops including vegetables, beans, sugarcane and maize.

**Upland** are mostly found in the undulating relief of hill slopes. The soil textures are sandy with well drained. The soil contains a certain amount of lime with rich in calcium (Ca) and magnesium (Mg). The soil has low nutrients such as nitrogen (N), phosphorus (P) and potassium (K). In addition, at the present there is a risk of soil degradation caused by strong soil erosion. In order to plant cultivation, soil management, it should be considered by using green manure or organic manure and applied with suitable nitrogen and phosphate fertilizers.

## line CD of Tatkon Township

# Lowland soil : Gleysols

**ST2**

**ST3**

## **Limitation in agriculture**

Risk for flooding in rainy season. Soil has low primary nutrient elements (N,P,K), very low organic matter and topsoil has coarse texture are influenced by flooding from river.
